

Fig. S3. Biogeography and habitat coverage of ASVs assigned to the final genomes. Distribution of the relative abundance per sample of ASVs corresponding to the final genomes across three large-scale metabarcoding datasets: BBMO (32 samples), OSD (319 samples), and EukBank (8435 samples). The EukBank dataset is further subdivided into five major habitat categories: marine water (6545 samples), marine sediment (634 samples), freshwater (237 samples), freshwater sediment (153 samples) and soils (866 samples).
