

Fig. S6. Phylogenetic tree to place SCG rhodopsin genes. Rhodopsin genes from SAGs (158 genes; bold in the tree) were retrieved with the Pfam domain PF01036 from the *ncge* annotations, and combined with the sequences (and arrow delimitation) presented in Galindo et al. 2025 and with 52 MarFERRet sequences that had $\geq 97\%$ identity in Pfam.
