

Fig. S9. Phylogenetic tree to place rhodopsin genes extracted from SAGs. Rhodopsin genes (158 genes; bold in the tree) were retrieved with the Pfam domain PF01036 from the gene annotations, and combined with the sequences (and group delineation) presented in Galindo et al. 2025 (40) and with 52 MarFERRet sequences that had < 97% identity to PNAS references for a phylogenetic tree. The phylogenetic group of each sequence is indicated after the name.
